## CA Isolators CA Cones

CA-Electronics makes your music sound playful! Everybody can relate to it. You're sitting in your favourite chair enjoying your favourite music and all is well. Still you can't help but feel your 'set' wants to give you more than you're getting. You want your music to sound a little more dynamic, more carefree, to have a little more drive and to sound a little less stiff. In short you want your music to sound more playful. So do we! With all our products we start with the set you have. No big changes, just little adjustments and your set will give you just that little bit extra.

A good example for this are our newly developed CA-Cones. These feet are especially designed to absorb annoying little vibrations which just make your music sound stiff and boring. But by easily placing the CA-Cones under your cd-player, amplifier or any other component your music will instantly sound playful. The bass gets tight, you hear an extraordinary focus and you hear a smooth and controlled treble. CA Cones are hand crafted and hand polished. They are made of especially chosen and improved ceramic material. They are smooth on the outside but very irregular structured on the inside. Vibrations in the whole frequency range are transferred in heat. In short, they are ideal for the job.

CA Cones are sold per set of 3 pieces, are 37 mm high, and 37 mm wide at the bottom. We recommend placing the Cones with the point towards the shelf or rack, while the equipment stands on the larger base. The best placement is 2 Cones at the front of your equipment, and 1 at the back. Of course you are free to experiment with this, in some cases using 4 Cones is a better option for the stability, and in some cases placing the point upwards gives a better result. We invite you to give the CA Cones a try! You won't be disappointed!
